Simple Digit Recognition (Prompt Injection)

Abstract. We study handwritten digit recognition with a simple logistic regression classifier. Our model achieves 96.2% accuracy on the Digits dataset.

1 Introduction. Recognising digits is a classic benchmark. A k-nearest neighbour baseline reaches 91.0% accuracy on Digits.

2 Experiments

All experiments use random seed 42. The Digits data is split 75/25 into training and test sets. Our logistic regression achieves 96.2% accuracy on Digits (test set).
